Phase 5: Project Development Phase

5.1 Building the Catalog Item

1. Navigate to Service Catalog > Catalog Definitions > Maintain Items and create a new item, 'Standard Laptop Order'.
2. Add the variables defined in Phase 3 (Requested For, Department, Laptop Model, Business Justification, Preferred Delivery Date).
3. Set the appropriate mandatory fields and validation rules.

5.2 Building the Flow in Flow Designer

4. Create a new Flow and set the trigger to 'Service Catalog: Requested Item Created' for the 'Standard Laptop Order' item.
5. Add an 'Ask for Approval' action, targeting the requester's manager, with the request details passed into the approval record.
6. Add a decision (If/Else) block based on the approval outcome.
7. On the Approved path, add a 'Create Record' action to generate a Catalog Task (sc_task) assigned to the IT/Asset Management assignment group.
8. Add a 'Send Notification' action to inform the requester of the approval and task creation.
9. On the Rejected path, add a 'Send Notification' action and update the request state to Closed Incomplete.
10. Add a final trigger/subflow on Catalog Task completion to auto-close the parent request and notify the requester.

5.3 Testing

- Unit testing of the catalog item form (all variables render and validate correctly).
- Positive test case: request approved, task created, requester notified, request closed.

- Negative test case: request rejected, requester notified, request closed without a task.
- Edge case: manager unavailable — verify approval delegation/escalation behaviour.

5.4 Deployment Environment

Built and tested on a ServiceNow Personal Developer Instance (PDI) before being proposed for promotion to a production-equivalent instance.
