Phase 2: Requirement Analysis

2.1 Stakeholders

Stakeholder	Role in the Process
Employee (Requester)	Raises the laptop request via the Service Catalog
Reporting Manager	Approves or rejects the request
IT / Asset Management Team	Fulfils the approved request, assigns the asset
System Administrator	Configures and maintains the catalog item and flow
ServiceNow Platform	Hosts the Service Catalog, Flow Designer, and records

2.2 Functional Requirements

- A Service Catalog item named 'Standard Laptop Order' with fields such as Requested For, Department, Laptop Model/Configuration, and Business Justification.
- Automatic routing of the request to the requester's manager for approval.
- Automatic creation of a fulfilment task (Catalog Task) assigned to the IT/Asset team on approval.
- Automatic email/notification to the requester at each state change: Submitted, Approved, Rejected, Fulfilled/Closed.
- Automatic closure of the request once the fulfilment task is marked complete.
- A status field that is always visible to the requester (e.g., via 'My Requests').

2.3 Non-Functional Requirements

- **Usability:** The catalog form must be simple enough for a non-technical employee to complete in under two minutes.

- **Reliability:** The Flow must trigger consistently with no manual intervention required for standard cases.
- **Scalability:** The design should support high request volumes without redesign.
- **Auditability:** Every approval and status change must be timestamped and traceable.
- **Security:** Only the requester, their manager, and authorized IT staff can view/act on a given request.

2.4 Tools & Technology

Component	Technology Used
Platform	ServiceNow (Personal Developer Instance / PDI)
Request Intake	Service Catalog & Catalog Item / Record Producer
Automation Engine	Flow Designer
Approval Mechanism	Flow Designer 'Ask for Approval' action
Fulfilment Tracking	Catalog Task (sc_task)
Notifications	Flow Designer 'Send Email/Notification' action
