Phase 7: Project Demonstration

7.1 Demonstration Script

1. Log in as an employee and raise a 'Standard Laptop Order' request through the Service Catalog.
2. Show the automatically generated approval record assigned to the manager.
3. Log in as the manager and approve the request.
4. Show the automatically created Catalog Task assigned to the IT/Asset team, and the notification received by the requester.
5. Log in as IT staff, complete the fulfillment task.
6. Show the parent request auto-closing and the final notification received by the requester.
7. (Optional) Repeat steps 1–3 with a rejection to demonstrate the alternate path.

7.2 Outcomes Demonstrated

- End-to-end automation of a process that was previously manual and email-based.
- A complete, auditable trail from request to closure with no manual coordination required.
- Real-time visibility for the requester at every stage.

7.3 Future Enhancements

- Integrate with vendor/procurement APIs to auto-generate a purchase order for approved requests.
- Add a multi-level approval path for high-cost or non-standard configurations.
- Add a dashboard/report for IT leadership showing request volume, turnaround time, and rejection rate.
- Extend the same pattern to other standard IT asset requests (monitors, headsets, mobile devices).

7.4 Conclusion

This project demonstrates how ServiceNow's Service Catalog and Flow Designer can be used together to convert a slow, manual, email-driven IT procurement process into a fast, transparent, and fully auditable automated workflow — improving the experience for employees, managers, and the IT fulfillment team alike.
