Phase 6: Project Documentation

6.1 User Guide (For Employees)

1. Go to the Service Catalog and search for 'Standard Laptop Order'.
2. Fill in the required fields: who the laptop is for, department, laptop model, and justification.
3. Submit the request.
4. Track the request status under 'My Requests'; you will be notified by email at each stage.

6.2 Technical Documentation (For Administrators)

- Catalog item name and sys_id, variable set, and validation logic.
- Flow name, trigger condition, and a description of each action node (Approval, Decision, Create Record, Send Notification).
- Assignment group configuration for the fulfilment task.
- Notification templates used for Submitted / Approved / Rejected / Fulfilled states.

6.3 Test Case Log

Test Case	Steps	Expected Result	Status
Submit valid request	Fill form, submit	Request created, approval triggered	Pass
Manager approves	Approve via approval record	Task auto-created, requester notified	Pass
Manager rejects	Reject via approval record	Requester notified, request closed	Pass
Task completed	IT marks task Complete	Parent request auto-closes	Pass

6.4 Lessons Learned

- Clear, restricted choice lists (e.g., predefined laptop models) reduce downstream fulfilment errors.
- Explicit notification at every state change is what most improves the requester's experience.
- Building and testing incrementally (trigger → approval → task → closure) is easier to debug than building the full flow at once.
