Phase 3: Project Design Phase

3.1 Catalog Item Design

A new Service Catalog item, 'Standard Laptop Order', is designed with the following variables:

Field Name	Type	Purpose
Requested For	Reference (User)	Identifies who the laptop is for
Department	Reference/Choice	Used for cost-centre and reporting
Laptop Model	Choice (predefined list)	Restricts requests to standard, pre-approved models
Business Justification	Multi-line text	Reason for the request, shown to the approver
Preferred Delivery Date	Date	Helps IT plan fulfilment

3.2 Process / Flow Design

The end-to-end flow is designed in five stages:

1. Trigger: A new record is created in the Service Catalog request table (sc_req_item) when the catalog item is submitted.
2. Approval: Flow Designer's 'Ask for Approval' action routes the request to the requester's manager.
3. Decision Branch: If approved → proceed to fulfilment; If Rejected → notify requester and close the request.
4. Fulfilment Task Creation: On approval, a Catalog Task (sc_task) is auto-created and assigned to the IT/Asset Management group.

5. Closure & Notification: When the task is marked Complete, the parent request is closed, and the requester receives a final notification.

3.3 High-Level Flow Diagram (Textual Representation)

Employee submits 'Standard Laptop Order' → Flow Trigger fires → Approval requested from Manager → [Approved] → Catalog Task created & assigned to IT → IT fulfils & marks task Complete → Request auto-closed → Requester notified. [Rejected] → Requester notified → Request closed.

3.4 Data Model

- sc_cat_item — stores the catalog item definition.
- sc_request / sc_req_item — stores each submitted request and its state.
- sc_task — stores the fulfilment task assigned to IT.
- sysapproval_approver — stores the approval record and approver's decision.
